- Architecture
 - tightly coupled (e.g. Cray, Blue Gene)
 - loosely coupled such as network of workstations
 - GPU clusters (many vector and sparse matrix kernels)
- Operating systems (Linux, Mac, Windows, BSD, proprietary Unix)
- Any compiler
- Real/complex, single/double/quad precision, 32/64-bit int
- Usable from C, C++, Fortran 77/90, Python, and MATLAB
- Free to everyone (2-clause BSD license), open development
- 10¹² unknowns, full-machine scalability on Top-10 systems
- Same code runs performantly on a laptop

- Free to everyone (2-clause BSD license), open development
- 10¹² unknowns, full-machine scalability on Top-10 systems
- Same code runs performantly on a laptop
- iPhone support

Philosophy: Everything has a plugin architecture

- Vectors, Matrices, Coloring/ordering/partitioning algorithms
- Preconditioners, Krylov accelerators
- Nonlinear solvers, Time integrators
- Spatial discretizations/topology*

Example

Vendor supplies matrix format and associated preconditioner, distributes compiled shared library. Application user loads plugin at runtime, no source code in sight.

Algorithms, (parallel) debugging aids, low-overhead profiling

Composability

Try new algorithms by choosing from product space and composing existing algorithms (multilevel, domain decomposition, splitting).

Experimentation

- It is not possible to pick the solver <u>a priori</u>.
 What will deliver best/competitive performance for a given physics, discretization, architecture, and problem size?
- PETSc's response: expose an algebra of composition so new solvers can be created at runtime.
- Important to keep solvers decoupled from physics and discretization because we also experiment with those.

- Computational Scientists
 - PyLith (CIG), Underworld (Monash), Climate (ICL/UK Met), PFLOTRAN (DOE), MOOSE (DOE), Proteus (ERDC)
- Algorithm Developers (iterative methods and preconditioning)
- Package Developers
 - SLEPc, TAO, Deal.II, Libmesh, FEniCS, PETSc-FEM, MagPar, OOFEM, FreeCFD, OpenFVM
- Funding
 - Department of Energy
 - SciDAC, ASCR ISICLES, MICS Program, INL Reactor Program
 - National Science Foundation
 - CIG, CISE, Multidisciplinary Challenge Program
- Hundreds of tutorial-style examples
- Hyperlinked manual, examples, and manual pages for all routines
- Support from petsc-maint@mcs.anl.gov

Outline

Introduction

2 Objects - Building Blocks of the Code

- 3 Options Database Controling the Code
- 4 Why Parallel?
- Core PETSc Components and Algorithms Primer Nonlinear solvers: SNES Linear Algebra background/theory Profiling Matrix Redux

MPI communicators

- Opaque object, defines process group and synchronization channel
- PETSc objects need an MPI_Comm in their constructor
 - PETSC_COMM_SELF for serial objects
 - PETSC_COMM_WORLD common, but not required
- Can split communicators, spawn processes on new communicators, etc
- Operations are one of
 - Not Collective: VecGetLocalSize(), MatSetValues()
 - Logically Collective: KSPSetType(), PCMGSetCycleType()
 - checked when running in debug mode
 - Neighbor-wise Collective: VecScatterBegin(), MatMult()
 - Point-to-point communication between two processes
 - Neighbor collectives in MPI-3
 - Collective: VecNorm(), MatAssemblyBegin(), KSPCreate()
 - Global communication, synchronous
 - Non-blocking collectives in MPI-3
- Deadlock if some process doesn't participate (e.g. wrong order)

Objects

```
Mat A;
PetscInt m,n,M,N;
MatCreate(comm,&A);
MatSetSizes(A,m,n,M,N);  /* or PETSC_DECIDE */
MatSetOptionsPrefix(A, "foo_");
MatSetFromOptions(A);
/* Use A */
MatView(A,PETSC_VIEWER_DRAW_WORLD);
MatDestroy(A);
```

- Mat is an opaque object (pointer to incomplete type)
 - Assignment, comparison, etc, are cheap
- What's up with this "Options" stuff?
 - Allows the type to be determined at runtime: -foo_mat_type sbaij
 - Inversion of Control similar to "service locator", related to "dependency injection"
 - Other options (performance and semantics) can be changed at runtime under -foo_mat_

Basic PetscObject Usage

Every object in PETSc supports a basic interface

Function	Operation
Create()	create the object
Get/SetName()	name the object
Get/SetType()	set the implementation type
Get/SetOptionsPrefix()	set the prefix for all options
SetFromOptions()	customize object from the command line
SetUp()	preform other initialization
View()	view the object
Destroy()	cleanup object allocation
Also, all objects support the -help option.

Ways to set options

- Command line
- Filename in the third argument of PetscInitialize()
- ~/.petscrc
- \$PWD/.petscrc
- \$PWD/petscrc
- PetscOptionsInsertFile()
- PetscOptionsInsertString()
- PETSC_OPTIONS environment variable
- command line option options_file [file]

Try it out

- \$ make tests/snes/examples/tutorials/ex5
- \$ cd tests/snes/examples/tutorials
 - \$./ex5 -da_grid_x 10 -da_grid_y 10 -par 6.7 \
 -snes_monitor -{ksp,snes}_converged_reason \
 -snes_view
 - \$./ex5 -da_grid_x 10 -da_grid_y 10 -par 6.7 \
 -snes_monitor -{ksp,snes}_converged_reason \
 -snes_view -ksp_view_mat draw -draw_pause -1
 - \$./ex5 -da_grid_x 10 -da_grid_y 10 -par 6.7 \
 -snes_monitor -{ksp,snes}_converged_reason \
 -snes_view -pc_type lu \
 -pc_factor_mat_ordering_type natural
 - Use -help to find other ordering types

```

Jed Brown and Tobin Isaac and Karl Rupp (CU Bohttps://jedbrown.org/files/20190226-PETScSolvers.SIAM CSE, 2019-02-26, Spokane, WA 20/97

In parallel

- \$ mpiexec -n 4 ./ex5 \
 -da_grid_x 10 -da_grid_y 10 -par 6.7 \
 -snes_monitor -{ksp,snes}_converged_reason \
 -snes_view -sub_pc_type lu
- How does the performance change as you
 - vary the number of processes (up to 32 or 64)?
 - increase the problem size?
 - use an inexact subdomain solve?
 - try an overlapping method: -pc_type asm -pc_asm_overlap 2
 - simulate a big machine: -pc_asm_blocks 512
 - change the Krylov method: -ksp_type ibcgs
 - use algebraic multigrid: -pc_type hypre
 - use smoothed aggregation multigrid: -pc_type gamg or -pc_type ml

→ Ξ →

Why Parallel?

- Solve a fixed problem faster
- Obtain a more accurate solution in the same amount of time
- Solve a more complicated problem in the same amount of time
- Use more memory than available on one machine

Strong Scaling

Efficiency versus Number of Processes

Jed Brown and Tobin Isaac and Karl Rupp (CU Bohttps://jedbrown.org/files/20190226-PETScSolvers.SIAM CSE, 2019-02-26, Spokane, WA 25/97

Efficiency versus Time

Jed Brown and Tobin Isaac and Karl Rupp (CU Bohttps://jedbrown.org/files/20190226-PETScSolvers.SIAM CSE, 2019-02-26, Spokane, WA 26/97

Scaling Challenges

The easiest way to make software scalable is to make it sequentially inefficient. (Gropp 1999)

- Solver iteration count may increase from
 - increased resolution
 - model parameters (e.g., coefficient contrast/structure)
 - more realistic models (e.g., plasticity)
 - model coupling
- Algorithm may have suboptimal complexity (e.g., direct solver)
- Increasing spatial resolution requires more time steps (usually)
- Implementation/data structures may not scale
- Architectural effects cache, memory

Why Parallel?

Accuracy-time tradeoffs: de rigueur in ODE community

[Hairer and Wanner (1999)]

• Tests discretization, adaptivity, algebraic solvers, implementation

No reference to number of time steps, number of grid points, etc.

5 Core PETSc Components and Algorithms Primer Nonlinear solvers: SNES

Linear Algebra background/theory Profiling Matrix Redux

.

Newton iteration: workhorse of SNES

Standard form of a nonlinear system

F(u) = 0

Iteration

Solve: J(u)w = -F(u)Update: $u^+ \leftarrow u + w$

• Quadratically convergent near a root: $\left|u^{n+1}-u^{*}
ight|\in\mathscr{O}ig(\left|u^{n}-u^{*}
ight|^{2}ig)$

• Picard is the same operation with a different J(u)

Example (Nonlinear Poisson)

$$F(u) = 0 \quad \sim \quad -\nabla \cdot \left[(1+u^2)\nabla u \right] - f = 0$$
$$J(u)w \quad \sim \quad -\nabla \cdot \left[(1+u^2)\nabla w + 2uw\nabla u \right]$$

SNES Paradigm

The SNES interface is based upon callback functions

- FormFunction(), set by SNESSetFunction()
- FormJacobian(), set by SNESSetJacobian()

When PETSc needs to evaluate the nonlinear residual F(x),

- Solver calls the user's function
- User function gets application state through the ctx variable
 - PETSc never sees application data

SNES Function

The user provided function which calculates the nonlinear residual has signature

PetscErrorCode (*func)(SNES snes,Vec x,Vec r,void *ctx)

- x: The current solution
- r: The residual
- ctx: The user context passed to SNESSetFunction()
 - Use this to pass application information, e.g. physical constants

SNES Jacobian

The user provided function that calculates the Jacobian has signature

- x: The current solution
- J: The Jacobian
- Jpre: The Jacobian preconditioning matrix (possibly J itself)
- ctx: The user context passed to SNESSetFunction()
 - Use this to pass application information, e.g. physical constants
 - Alternatively, you can use
 - a builtin sparse finite difference approximation ("coloring")

Linear Algebra background/theory

Profiling Matrix Redux
Matrices

Definition (Matrix)

A matrix is a linear transformation between finite dimensional vector spaces.

Definition (Forming a matrix)

Forming or assembling a matrix means defining it's action in terms of entries (usually stored in a sparse format).

Matrices

Definition (Matrix)

A matrix is a linear transformation between finite dimensional vector spaces.

Definition (Forming a matrix)

Forming or assembling a matrix means defining it's action in terms of entries (usually stored in a sparse format).

- 1 Sparse (e.g. discretization of a PDE operator)
- 2 Inverse of anything interesting $B = A^{-1}$
- 3 Jacobian of a nonlinear function $Jy = \lim_{\varepsilon \to 0} \frac{F(x+\varepsilon y) F(x)}{\varepsilon}$
- 4 Fourier transform $\mathscr{F}, \mathscr{F}^{-1}$
- 5 Other fast transforms, e.g. Fast Multipole Method
- **6** Low rank correction $B = A + uv^T$
- **7** Schur complement $S = D CA^{-1}B$
- **8** Tensor product $A = \sum_e A_x^e \otimes A_y^e \otimes A_z^e$
- Substitution of a few steps of an explicit integrator

- Sparse (e.g. discretization of a PDE operator)
- 2 Inverse of <u>anything</u> interesting $B = A^{-1}$
- **3** Jacobian of a nonlinear function $Jy = \lim_{\varepsilon \to 0} \frac{F(x+\varepsilon y) F(x)}{\varepsilon}$
- **4** Fourier transform $\mathcal{F}, \mathcal{F}^{-1}$
- 5 Other fast transforms, e.g. Fast Multipole Method
- **6** Low rank correction $B = A + uv^T$
- **7** Schur complement $S = D CA^{-1}B$
- 8 Tensor product $A = \sum_e A_x^e \otimes A_y^e \otimes A_z^e$
- Sinearization of a few steps of an explicit integrator
 - These matrices are dense. Never form them.

- 1 Sparse (e.g. discretization of a PDE operator)
- 2 Inverse of anything interesting $B = A^{-1}$
- 3 Jacobian of a nonlinear function $Jy = \lim_{\varepsilon \to 0} \frac{F(x+\varepsilon y) F(x)}{\varepsilon}$
- 4 Fourier transform $\mathscr{F}, \mathscr{F}^{-1}$
- 5 Other fast transforms, e.g. Fast Multipole Method
- **6** Low rank correction $B = A + uv^T$
- **7** Schur complement $S = D CA^{-1}B$
- 8 Tensor product $A = \sum_e A_x^e \otimes A_y^e \otimes A_z^e$
- Substitution of a few steps of an explicit integrator
 - These are not very sparse. Don't form them.

- Sparse (e.g. discretization of a PDE operator)
- 2 Inverse of <u>anything</u> interesting $B = A^{-1}$
- **3** Jacobian of a nonlinear function $Jy = \lim_{\varepsilon \to 0} \frac{F(x+\varepsilon y) F(x)}{\varepsilon}$
- **4** Fourier transform $\mathscr{F}, \mathscr{F}^{-1}$
- 5 Other fast transforms, e.g. Fast Multipole Method
- **6** Low rank correction $B = A + uv^T$
- **7** Schur complement $S = D CA^{-1}B$
- 8 Tensor product $A = \sum_e A_x^e \otimes A_y^e \otimes A_z^e$
- Substitution of a few steps of an explicit integrator
 - None of these matrices "have entries"

What can we do with a matrix that doesn't have entries?

Krylov solvers for Ax = b

- Krylov subspace: {*b*, *Ab*, *A*²*b*, *A*³*b*, ... }
- Convergence rate depends on the spectral properties of the matrix
 - Existance of small polynomials $p_n(A) < \varepsilon$ where $p_n(0) = 1$.
 - condition number $\kappa({ extsf{A}}) = \|{ extsf{A}}\| \, \|{ extsf{A}}^{-1}\| = \sigma_{ extsf{max}}/\sigma_{ extsf{min}}$
 - distribution of singular values, spectrum Λ , pseudospectrum Λ_{ϵ}
- For any popular Krylov method \mathcal{K} , there is a matrix of size m, such that \mathcal{K} outperforms all other methods by a factor at least $\mathcal{O}(\sqrt{m})$ [Nachtigal et. al., 1992]

Typically...

- The action $y \leftarrow Ax$ can be computed in $\mathscr{O}(m)$
- Aside from matrix multiply, the n^{th} iteration requires at most $\mathscr{O}(mn)$

GMRES

Brute force minimization of residual in $\{b, Ab, A^2b, ...\}$

1 Use Arnoldi to orthogonalize the *n*th subspace, producing

$$AQ_n = Q_{n+1}H_n$$

2 Minimize residual in this space by solving the overdetermined system

$$H_n y_n = e_1^{(n+1)}$$

using *QR*-decomposition, updated cheaply at each iteration.

Properties

- Converges in *n* steps for all right hand sides if there exists a polynomial of degree *n* such that ||*p_n(A)*|| < tol and *p_n(0)* = 1.
- Residual is monotonically decreasing, robust in practice
- Restarted variants are used to bound memory requirements

Preconditioning

Idea: improve the conditioning of the Krylov operator

Left preconditioning

$$(P^{-1}A)x = P^{-1}b$$

 $\{P^{-1}b, (P^{-1}A)P^{-1}b, (P^{-1}A)^2P^{-1}b, \dots\}$

Right preconditioning

$$(AP^{-1})Px = b$$

 $\{b, (AP^{-1}b, (AP^{-1})^2b, \dots\}$

Definition (Preconditioner)

A preconditioner \mathscr{P} is a method for constructing a matrix (just a linear function, not assembled!) $P^{-1} = \mathscr{P}(A, A_p)$ using a matrix A and extra information A_p , such that the spectrum of $P^{-1}A$ (or AP^{-1}) is well-behaved.

Preconditioning

Definition (Preconditioner)

A <u>preconditioner</u> \mathscr{P} is a method for constructing a matrix $P^{-1} = \mathscr{P}(A, A_p)$ using a matrix *A* and extra information A_p , such that the spectrum of $P^{-1}A$ (or AP^{-1}) is well-behaved.

- P^{-1} is dense, P is often not available and is not needed
- A is rarely used by \mathscr{P} , but $A_p = A$ is common
- A_p is often a sparse matrix, the "preconditioning matrix"
- Matrix-based: Jacobi, Gauss-Seidel, SOR, ILU(k), LU
- Parallel: Block-Jacobi, Schwarz, Multigrid, FETI-DP, BDDC
- Indefinite: Schur-complement, Domain Decomposition, Multigrid

Questions to ask when you see a matrix

- 1 What do you want to do with it?
 - Multiply with a vector
 - Solve linear systems or eigen-problems
- 2 How is the conditioning/spectrum?
 - distinct/clustered eigen/singular values?
 - symmetric positive definite (σ(A) ⊂ ℝ⁺)?
 - nonsymmetric definite ($\sigma(A) \subset \{z \in \mathbb{C} : \Re[z] > 0\}$)?
 - indefinite?
- 3 How dense is it?
 - block/banded diagonal?
 - sparse unstructured?
 - denser than we'd like?
- Is there a better way to compute Ax?
- Is there a different matrix with similar spectrum, but nicer properties?
- 6 How can we precondition A?

Questions to ask when you see a matrix

- 1 What do you want to do with it?
 - Multiply with a vector
 - Solve linear systems or eigen-problems
- 2 How is the conditioning/spectrum?
 - distinct/clustered eigen/singular values?
 - symmetric positive definite (σ(A) ⊂ ℝ⁺)?
 - nonsymmetric definite ($\sigma(A) \subset \{z \in \mathbb{C} : \Re[z] > 0\}$)?
 - indefinite?
- 3 How dense is it?
 - block/banded diagonal?
 - sparse unstructured?
 - denser than we'd like?
- Is there a better way to compute Ax?
- Is there a different matrix with similar spectrum, but nicer properties?
- 6 How can we precondition A?

Relaxation

Split into lower, diagonal, upper parts: A = L + D + U

Jacobi $-pc_type$ jacobi Cheapest preconditioner: $P^{-1} = D^{-1}$

Successive over-relaxation (SOR) -pc_type sor

$$\left(L + \frac{1}{\omega}D\right)x_{n+1} = \left[\left(\frac{1}{\omega} - 1\right)D - U\right]x_n + \omega b$$
$$P^{-1} = k \text{ iterations starting with } x_0 = 0$$

- Implemented as a sweep
- $\omega = 1$ corresponds to Gauss-Seidel
- Very effective at removing high-frequency components of residual

> < 臣 > < 臣 > < 臣</p>

Preconditioned Richardson convergence

The Richardson iteration for Ax = b with preconditioner ωP^{-1} is

$$x_{n+1} = x_n + \omega P^{-1}(b - Ax_n)$$

• If
$$X_*$$
 is a solution $Ax_* = b$ then

$$\underbrace{x_{n+1} - x_{*}}_{e_{n+1}} = \underbrace{x_{n} - x_{*}}_{e_{n}} - \omega P^{-1} A(\underbrace{x_{n} - x_{*}}_{e_{n}}) = (I - \omega P^{-1} A) e_{n}$$
$$e_{n} = (I - \omega P^{-1} A)^{n} e_{0}$$

• If $||I - \omega P^{-1}A|| < 1$ then we get convergence with any initial guess x_0

• If an eigendecomposition $X\Lambda X^{-1} = I - \omega P^{-1}A$ exists, we would like to choose ω to minimize the maximum eigenvalue magnitude.

Factorization

Two phases

- symbolic factorization: find where fill occurs, only uses sparsity pattern
- numeric factorization: compute factors

LU decomposition

- Ultimate preconditioner
- Expensive, for $m \times m$ sparse matrix with bandwidth *b*, traditionally requires $\mathscr{O}(mb^2)$ time and $\mathscr{O}(mb)$ space.
 - Bandwidth scales as $m^{\frac{d-1}{d}}$ in *d*-dimensions
 - Optimal in 2D: $\mathcal{O}(m \cdot \log m)$ space, $\mathcal{O}(m^{3/2})$ time
 - Optimal in 3D: $\mathcal{O}(m^{4/3})$ space, $\mathcal{O}(m^2)$ time
- Symbolic factorization is problematic in parallel

Incomplete LU

- Allow a limited number of levels of fill: ILU(k)
- Only allow fill for entries that exceed threshold: ILUT
- Usually poor scaling in parallel
- No guarantees
- Hierarchical/low-rank representations have potential: STRUMPACK

1-level Domain decomposition

Domain size L, subdomain size H, element size h

Overlapping/Schwarz

- Solve Dirichlet problems on overlapping subdomains
- No overlap: *its* $\in \mathscr{O}\left(\frac{L}{\sqrt{Hh}}\right)$
- Overlap δ : *its* $\in \mathscr{O}\left(\frac{L}{\sqrt{H\delta}}\right)$

Neumann-Neumann

- Solve Neumann problems on non-overlapping subdomains
- *its* $\in \mathscr{O}\left(\frac{L}{H}(1 + \log \frac{H}{h})\right)$
- Tricky null space issues (floating subdomains)
- Need subdomain matrices, not globally assembled matrix.
- Multilevel variants knock off the leading ^L/_H
- Both overlapping and nonoverlapping with this bound

Multigrid

Hierarchy: Interpolation and restriction operators

$$\mathscr{I}^{\uparrow}: X_{\text{coarse}} \to X_{\text{fine}} \qquad \mathscr{I}^{\downarrow}: X_{\text{fine}} \to X_{\text{coarse}}$$

- · Geometric: define problem on multiple levels, use grid to compute hierarchy
- Algebraic: define problem only on finest level, use matrix structure to build hierarchy

Galerkin approximation

Assemble this matrix: $A_{\text{coarse}} = \mathscr{I}^{\downarrow} A_{\text{fine}} \mathscr{I}^{\uparrow}$

Application of multigrid preconditioner (V-cycle)

- Apply pre-smoother on fine level (any preconditioner)
- Restrict residual to coarse level with \mathscr{I}^{\downarrow}
- Solve on coarse level $A_{\text{coarse}}x = r$
- Interpolate result back to fine level with *I*[↑]
- Apply post-smoother on fine level (any preconditioner)

Multigrid convergence properties

- Textbook: $P^{-1}A$ is spectrally equivalent to identity
 - Constant number of iterations to converge up to discretization error
- Most theory applies to SPD systems
 - variable coefficients (e.g. discontinuous): low energy interpolants
 - mesh- and/or physics-induced anisotropy: semi-coarsening/line smoothers
 - complex geometry: difficult to have meaningful coarse levels
- Deeper algorithmic difficulties
 - nonsymmetric (e.g. advection, shallow water, Euler)
 - indefinite (e.g. incompressible flow, Helmholtz)
- Performance considerations
 - Aggressive coarsening is critical in parallel
 - Most theory uses SOR smoothers, ILU often more robust
 - Coarsest level usually solved semi-redundantly with direct solver
- Multilevel Schwarz is essentially the same with different language
 - assume strong smoothers, emphasize aggressive coarsening

Norms

- Krylov subspace: $\{P^{-1}b, (P^{-1}A)P^{-1}b, (P^{-1}A)^2P^{-1}b, \dots\}$
- Subspace needs to contain the solution
 - Diameter of preconditioned connectivity graph
- Need to find the correct linear combination
 - Optimize unpreconditioned residual norm (usually right preconditioning)

$$\|Ax - b\|_2 = \|A(x - x^*)\|_2 = \|x - x^*\|_{A^T A}$$

Optimize preconditioned residual norm (usually left preconditioning)

$$\left\|P^{-1}(Ax-b)\right\|_{2} = \left\|P^{-1}A(x-x^{*})\right\|_{2} = \left\|x-x^{*}\right\|_{A^{T}P^{-T}P^{-1}A}$$

- Natural norm (conjugate gradients) minimizes $||x x^*||_{P^{-1/2}AP^{-1/2}}$
- Evaluating convergence
 - Preconditioned, unpreconditioned, or natural norm
 - Which one to trust?
 - -ksp_monitor_true_residual, -ksp_norm_type

Profiling

Matrix Redux

→ Ξ →

Profiling

- Use -log_view for a performance profile
 - Event timing
 - Event flops
 - Memory usage
 - MPI messages
- Call PetscLogStagePush() and PetscLogStagePop()
 - User can add new stages
- Call PetscLogEventBegin() and PetscLogEventEnd()
 - User can add new events
- Call PetscLogFlops () to include your flops

Reading -log_view

メロト メポト メヨト メヨト・コ

Communication Costs

- Reductions: usually part of Krylov method, latency limited
 - VecDot
 - VecMDot
 - VecNorm
 - MatAssemblyBegin
 - Change algorithm (e.g. IBCGS, PGMRES)
- Point-to-point (nearest neighbor), latency or bandwidth
 - VecScatter
 - MatMult
 - PCApply
 - MatAssembly
 - SNESFunctionEval
 - SNESJacobianEval
 - · Compute subdomain boundary fluxes redundantly
 - Ghost exchange for all fields at once, or overlap
 - Better partition

Nonlinear solvers: SNES Linear Algebra background/theory Profiling

Matrix Redux

Matrices, redux

What are PETSc matrices?

- Linear operators on finite dimensional vector spaces. (snarky)
- Fundamental objects for storing stiffness matrices and Jacobians
- Each process locally owns a contiguous set of rows
- Supports many data types
 - AIJ, Block AIJ, Symmetric AIJ, Block Diagonal, etc.
- Supports structures for many packages
 - MUMPS, SuperLU, UMFPack, Hypre, Elemental

Matrices, redux

What are PETSc matrices?

- Linear operators on finite dimensional vector spaces. (snarky)
- Fundamental objects for storing stiffness matrices and Jacobians
- Each process locally owns a contiguous set of rows
- Supports many data types
 - AIJ, Block AIJ, Symmetric AIJ, Block Diagonal, etc.
- Supports structures for many packages
 - MUMPS, SuperLU, UMFPack, Hypre, Elemental

How do I create matrices?

- MatCreate (MPI_Comm, Mat *)
- MatSetSizes(Mat, int m, int n, int M, int N)
- MatSetType(Mat, MatType typeName)
- MatSetFromOptions(Mat)
 - · Can set the type at runtime
- MatSetBlockSize(Mat, int bs)
 - for vector problems
- MatXAIJSetPreallocation(Mat,...)
 - important for assembly performance
- MatSetValues(Mat,...)
 - MUST be used, but does automatic communication
 - MatSetValuesLocal(), MatSetValuesStencil()
 - MatSetValuesBlocked()

Matrix Polymorphism

The PETSc Mat has a single user interface,

- Matrix assembly
 - MatSetValues()
- Matrix-vector multiplication
 - MatMult()
- Matrix viewing
 - MatView()

but multiple underlying implementations.

- AIJ, Block AIJ, Symmetric Block AIJ,
- Dense, Elemental
- Matrix-Free
- etc.

A matrix is defined by its interface, not by its data structure.

Matrix Assembly

- A three step process
 - Each process sets or adds values
 - Begin communication to send values to the correct process
 - Complete the communication
- MatSetValues(Mat A, m, rows[], n, cols[], values[], mode)
 - mode is either INSERT_VALUES or ADD_VALUES
 - Logically dense block of values
- Two phase assembly allows overlap of communication and computation
 - MatAssemblyBegin(Mat m, type)
 - MatAssemblyEnd(Mat m, type)
 - type is either MAT_FLUSH_ASSEMBLY or MAT_FINAL_ASSEMBLY
- For vector problems

MatSetValuesBlocked(Mat A, m, rows[],

n, cols[], values[], mode)

- The same assembly code can build matrices of different format
 - choose format at run-time.

Matrix Assembly

- A three step process
 - Each process sets or adds values
 - Begin communication to send values to the correct process
 - Complete the communication
- MatSetValues(Mat A, m, rows[], n, cols[], values[], mode)
 - mode is either INSERT_VALUES or ADD_VALUES
 - Logically dense block of values
- Two phase assembly allows overlap of communication and computation
 - MatAssemblyBegin(Mat m, type)
 - MatAssemblyEnd(Mat m, type)
 - type is either MAT_FLUSH_ASSEMBLY or MAT_FINAL_ASSEMBLY
- For vector problems

```
MatSetValuesBlocked(Mat A, m, rows[],
```

n, cols[], values[], mode)

- The same assembly code can build matrices of different format
 - choose format at run-time.

A Scalable Way to Set the Elements of a Matrix

Simple 3-point stencil for 1D Laplacian

```
v[0] = -1.0; v[1] = 2.0; v[2] = -1.0;
for (row = start; row < end; row++) {</pre>
  cols[0] = row-1; cols[1] = row; cols[2] = row+1;
  if (row == 0) {
    MatSetValues (A, 1, & row, 2, & cols [1], & v [1], INSERT VALUES);
  } else if (row == N-1) {
    MatSetValues (A, 1, & row, 2, cols, v, INSERT_VALUES);
  } else {
    MatSetValues(A,1,&row,3,cols,v,INSERT VALUES);
}
MatAssemblyBegin(A, MAT FINAL ASSEMBLY);
MatAssemblyEnd(A, MAT FINAL ASSEMBLY);
```

▶ ★ 臣 ▶ ★ 臣 ▶ ○ 臣 → の Q () ◆

Why Are PETSc Matrices That Way?

- No one data structure is appropriate for all problems
 - Blocked and diagonal formats provide significant performance benefits
 - PETSc has many formats and makes it easy to add new data structures
- Assembly is difficult enough without worrying about partitioning
 - PETSc provides parallel assembly routines
 - Achieving high performance still requires making most operations local
 - However, programs can be incrementally developed.
 - MatPartitioning and MatOrdering can help
- Matrix decomposition in contiguous chunks is simple
 - · Makes interoperation with other codes easier
 - For other ordering, PETSc provides "Application Orderings" (AO)

Approximating condition numbers

Small matrices:

Large matrices (avoid restarts!):

• Condition of preconditioned operator:

Try these:

- \$ cd \$PETSC_DIR/src/ksp/ksp/examples/tutorials \ && make ex2
- \$./ex2 -m 20 -n 20 <other_options>

Preliminary Conclusions

PETSc can help you

- solve algebraic and DAE problems in your application area
- rapidly develop efficient parallel code, can start from examples
- develop new solution methods and data structures
- debug and analyze performance
- advice on software design, solution algorithms, and performance
 - Public questions: petsc-users@mcs.anl.gov, archived
 - Private questions: petsc-maint@mcs.anl.gov, not archived

You can help PETSc

- report bugs and inconsistencies, or if you think there is a better way
- tell us if the documentation is inconsistent or unclear
- consider developing new algebraic methods as plugins, contribute if your idea works
Outline

6 Application Integration

Representative examples and algorithms Hydrostatic Ice

Driven cavity

8 Difficult and coupled problems

< ∃ >

-

Application Integration

- Be willing to experiment with algorithms
 - No optimality without interplay between physics and algorithmics
- Adopt flexible, extensible programming
 - Algorithms and data structures not hardwired
- Be willing to play with the real code
 - Toy models have limited usefulness
 - But make test cases that run quickly
- If possible, profile before integration
 - Automatic in PETSc

Incorporating PETSc into existing codes

- PETSc does not seize main (), does not control output
- Propogates errors from underlying packages, flexible error handling
- Nothing special about MPI_COMM_WORLD
- Can wrap existing data structures/algorithms
 - MatShell, PCShell, full implementations
 - VecCreateMPIWithArray()
 - MatCreateSeqAIJWithArrays()
 - Use an existing semi-implicit solver as a preconditioner
 - Usually worthwhile to use native PETSc data structures unless you have a good reason not to
- Uniform interfaces across languages
 - C, C++, Fortran 77/90, Python, MATLAB
- Do not have to use high level interfaces (e.g. SNES, TS, DM)
 - but PETSc can offer more if you do, like MFFD and SNES Test

Integration Stages

- Version Control
 - It is impossible to overemphasize
- Initialization
 - Linking to PETSc
- Profiling
 - Profile before changing
 - Also incorporate command line processing
- Linear Algebra
 - First PETSc data structures
- Solvers
 - Very easy after linear algebra is integrated

Initialization

Call PetscInitialize()

- Setup static data and services
- Setup MPI if it is not already
- Can set PETSC_COMM_WORLD to use your communicator (can always use subcommunicators for each object)
- **Call** PetscFinalize()
 - Calculates logging summary
 - Can check for leaks/unused options
 - Shutdown and release resources
- Can only initialize PETSc once

Matrix Memory Preallocation

- PETSc sparse matrices are dynamic data structures
 - can add additional nonzeros freely
- Dynamically adding many nonzeros
 - requires additional memory allocations
 - requires copies
 - can kill performance
- Memory preallocation provides
 - the freedom of dynamic data structures
 - good performance
- Easiest solution is to replicate the assembly code
 - Remove computation, but preserve the indexing code
 - Store set of columns for each row
- Call preallocation routines for all datatypes
 - MatSeqAIJSetPreallocation()
 - MatMPIBAIJSetPreallocation()
 - Only the relevant data will be used. Or MatXAIJSetPreallocation()

Sequential Sparse Matrices

MatSeqAIJSetPreallocation(Mat A, int nz, int nnz[])

nz: expected number of nonzeros in any row

nnz[i]: expected number of nonzeros in row i

Parallel Sparse Matrix

- Each process locally owns a submatrix of contiguous global rows
- Each submatrix consists of diagonal and off-diagonal parts

• MatGetOwnershipRange (Mat A, int *start, int *end) start: first locally owned row of global matrix end-1: last locally owned row of global matrix

Parallel Sparse Matrices

```
MatMPIAIJSetPreallocation(Mat A, int dnz, int
dnnz[],
int onz, int onnz[])
```

dnz: expected number of nonzeros in any row in the diagonal block

dnnz[i]: expected number of nonzeros in row i in the diagonal block

onz: expected number of nonzeros in any row in the offdiagonal portion onnz[i]: expected number of nonzeros in row i in the offdiagonal portion

Verifying Preallocation

Use runtime options

-mat_new_nonzero_location_err

-mat_new_nonzero_allocation_err

- Use -ksp_view or -snes_view and look for total number of mallocs used during MatSetValues calls =0
- Use runtime option -info
- Output:

```
[proc #] Matrix size: %d X %d; storage space:
%d unneeded, %d used
[proc #] Number of mallocs during MatSetValues( )
is %d
```

```
[merlin] mpirun ex2 -log_info
[0]MatAssemblyEnd_SeqAIJ:Matrix size: 56 X 56; storage space:
[0] 310 unneeded, 250 used
[0]MatAssemblyEnd_SeqAIJ:Number of mallocs during MatSetValues() is 0
[0]MatAssemblyEnd_SeqAIJ:Most nonzeros in any row is 5
```

Jed Brown and Tobin Isaac and Karl Rupp (CU Bohttps://jedbrown.org/files/20190226-PETScSolvers.SIAM CSE, 2019-02-26, Spokane, WA 74/97

Block and symmetric formats

BAIJ

- Like AIJ, but uses static block size
- Preallocation is like AIJ, but just one index per block

SBAIJ

- Only stores upper triangular part
- Preallocation needs number of nonzeros in upper triangular parts of on- and off-diagonal blocks
- MatSetValuesBlocked()
 - Better performance with blocked formats
 - Also works with scalar formats, if MatSetBlockSize() was called
 - Variants MatSetValuesBlockedLocal(), MatSetValuesBlockedStencil()
 - Change matrix format at runtime, don't need to touch assembly code

Linear Solvers

Krylov Methods

- Using PETSc linear algebra, just add:
 - KSPSetOperators(KSP ksp, Mat A, Mat Pmat)
 - KSPSolve(KSP ksp, Vec b, Vec x)
- Can access subobjects
 - KSPGetPC(KSP ksp, PC *pc)
- Preconditioners must obey PETSc interface
 - Basically just the KSP interface
- Can change solver dynamically from the command line, -ksp_type

Nonlinear Solvers

Newton and Picard Methods

Using PETSc linear algebra, just add:

- SNESSetFunction(SNES snes, Vec r, residualFunc, void *ctx)
- SNESSetJacobian(SNES snes, Mat A, Mat M, jacFunc, void *ctx)
- SNESSolve(SNES snes, Vec b, Vec x)
- Can access subobjects
 - SNESGetKSP(SNES snes, KSP *ksp)
- Can customize subobjects from the cmd line
 - Set the subdomain preconditioner to ILU with -sub_pc_type ilu

Hydrostatic equations for ice sheet flow

- Valid when $w_x \ll u_z$, independent of basal friction (Schoof&Hindmarsh 2010)
- Eliminate *p* and *w* from Stokes by incompressibility: 3D elliptic system for $\boldsymbol{u} = (u, v)$

$$-\nabla \cdot \left[\eta \begin{pmatrix} 4u_x + 2v_y & u_y + v_x & u_z \\ u_y + v_x & 2u_x + 4v_y & v_z \end{pmatrix}\right] + \rho g \overline{\nabla} h = 0$$

$$\eta(\theta, \gamma) = \frac{B(\theta)}{2} (\gamma_0 + \gamma)^{\frac{1-n}{2n}}, \qquad n \approx 3$$
$$\gamma = u_x^2 + v_y^2 + u_x v_y + \frac{1}{4} (u_y + v_x)^2 + \frac{1}{4} u_z^2 + \frac{1}{4} v_z^2$$

and slip boundary $\boldsymbol{\sigma} \cdot \boldsymbol{n} = \beta^2 \boldsymbol{u}$ where

$$\begin{split} \beta^2(\gamma_b) &= \beta_0^2 (\varepsilon_b^2 + \gamma_b)^{\frac{m-1}{2}}, \qquad 0 < m \leq 1\\ \gamma_b &= \frac{1}{2} (u^2 + v^2) \end{split}$$

• Q₁ FEM with Newton-Krylov-Multigrid solver in PETSc: src/snes/examples/tutorials/ex48.c

Some Multigrid Options

- -snes_grid_sequence: [0]
 Solve nonlinear problems on coarse grids to get initial guess
- -pc_mg_galerkin: [FALSE]
 Use Galerkin process to compute coarser operators
- -pc_mg_type: [FULL] (choose one of) MULTIPLICATIVE ADDITIVE FULL KASKADE
- -mg_coarse_{ksp,pc}_* control the coarse-level solver
- -mg_levels_{ksp,pc}_* control the smoothers on levels
- -mg_levels_3_{ksp,pc}_*
 control the smoother on specific level
- These also work with ML's algebraic multigrid.

What is this doing?

```
mpiexec -n 4 ./ex48 -M 16 -P 2 \
  -da refine hierarchy x 1,8,8 \setminus
  -da_refine_hierarchy_y 2,1,1 -da_refine_hierarchy_z 2,1,1
  -snes_grid_sequence 1 -log_view \
  -ksp_converged_reason -ksp_gmres_modifiedgramschmidt \
  -ksp_monitor -ksp_rtol 1e-2 \
  -pc_mg_type multiplicative \
  -mq_coarse_pc_type lu -mq_levels_0_pc_type lu \
  -mg_coarse_pc_factor_mat_solver_package mumps \
  -mg_levels_0_pc_factor_mat_solver_package mumps \
  -mg_levels_1_sub_pc_type cholesky \
  -snes_converged_reason -snes_monitor -snes_stol 1e-12 \
  -thi_L 80e3 -thi_alpha 0.05 -thi_friction_m 0.3 \
  -thi hom x -thi nlevels 4
```

- What happens if you remove -snes_grid_sequence?
- What about solving with block Jacobi, ASM, or algebraic multigrid?

▶ ▲ 臣 ▶ ▲ 臣 ▶ ▲ 臣 → � � �

Why isn't SNES converging?

- The Jacobian is wrong (maybe only in parallel)
 - Check with -snes_compare_explicit and -snes_mf_operator -pc_type lu
- The linear system is not solved accurately enough
 - Check with -pc_type lu
 - Check -ksp_monitor_true_residual, try right preconditioning
- The Jacobian is singular with inconsistent right side
 - Use MatNullSpace to inform the KSP of a known null space
 - Use a different Krylov method or preconditioner
- The nonlinearity is just really strong
 - Run with -snes_linesearch_monitor
 - Try using trust region instead of line search -snes_type newtontr
 - Try grid sequencing if possible
 - Use a continuation

Globalizing the lid-driven cavity

- Pseudotransient continuation (Ψtc)
 - Do linearly implicit backward-Euler steps, driven by steady-state residual
 - Residual-based adaptive controller retains quadratic convergence in terminal phase
- Implemented in src/ts/examples/tutorials/ex26.c
- \$./ex26 -ts_type pseudo -lidvelocity 100 -grashof 1e5 -da_grid_x 16 -da_grid_y 16 -ts_monitor
- Make the method nonlinearly implicit: -snes_type newtonls -snes_monitor
 - Compare required number of linear iterations
- Try error-based adaptivity: -ts_type rosw -ts_adapt_dt_min 1e-4
- Try increasing -lidvelocity, -grashof, and problem size
- Coffey, Kelley, and Keyes, <u>Pseudotransient continuation and differential</u> algebraic equations, SIAM J. Sci. Comp, 2003.

8 Difficult and coupled problems

→ Ξ →

-

Splitting for Multiphysics

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} f \\ g \end{bmatrix}$$

 Relaxation: -pc fieldsplit type [additive, multiplicative, symmetric_multiplicative] $\begin{bmatrix} A \\ D \end{bmatrix}^{-1} \begin{bmatrix} A \\ C \end{bmatrix}^{-1} \begin{bmatrix} A \\ C \end{bmatrix}^{-1} \begin{bmatrix} A \end{bmatrix}^{-1} \begin{pmatrix} A \end{pmatrix}^{-1} \begin{pmatrix} A \end{pmatrix}^{-$

$$\begin{bmatrix} A \\ C \end{bmatrix} \begin{bmatrix} A \\ C \end{bmatrix} \begin{bmatrix} A \\ -1 \end{bmatrix} \begin{bmatrix} A \\ -1 \end{bmatrix} \begin{bmatrix} A \\ -1 \end{bmatrix} \begin{bmatrix} A \\ C \end{bmatrix} = \begin{bmatrix} A \\ -1 \end{bmatrix} \begin{bmatrix} A \\ -1 \end{bmatrix}$$

- Gauss-Seidel inspired, works when fields are loosely coupled
- Factorization: -pc fieldsplit type schur

$$\begin{bmatrix} A & B \\ S \end{bmatrix}^{-1} \begin{bmatrix} 1 \\ CA^{-1} & 1 \end{bmatrix}^{-1}, \qquad S = D - CA^{-1}B$$

- robust (exact factorization), can often drop lower block
- how to precondition S which is usually dense?
 - interpret as differential operators, use approximate commutators

Coupled approach to multiphysics

- Smooth all components together
 - Block SOR is the most popular
 - Block ILU sometimes more robust (e.g. transport/anisotropy)
 - Vanka field-split smoothers or for saddle-point problems
 - Distributive relaxation
- Scaling between fields is critical
- Indefiniteness
 - Make smoothers and interpolants respect inf-sup condition
 - Difficult to handle anisotropy
 - Exotic interpolants for Helmholtz
- Transport
 - Define smoother in terms of first-order upwind discretization (*h*-ellipticity)
 - Evaluate residuals using high-order discretization
 - Use Schur field-split: "parabolize" at top level or for smoother on levels
- Multigrid inside field-split or field-split inside multigrid
- Open research area, hard to write modular software

Anisotropy, Heterogeneity

- Anisotropy
 - Semi-coarsening
 - Line smoothers
 - Order unknowns so that incomplete factorization "includes" a line smoother
- Heterogeneity
 - Make coarse grids align
 - Strong smoothers
 - Energy-minimizing interpolants
 - Galerkin coarse levels
 - Homogenization
- Mostly possible with generic software components

Algebraic Multigrid Tuning

Smoothed Aggregation (GAMG, ML)

- Graph/strength of connection MatSetBlockSize()
- Threshold (-pc_gamg_threshold)
- Aggregate (MIS, HEM)
- Tentative prolongation MatSetNearNullSpace()
- Eigenvalue estimate
- Chebyshev smoothing bounds
- BoomerAMG (Hypre)
 - Strong threshold (-pc_hypre_boomeramg_strong_threshold)
 - Aggressive coarsening options
